# 6. System test configuration

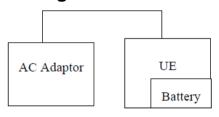

# 6.1 EUT Configuration

The EUT configuration for testing is installed on RF field strength measurement to meet the commission's requirement and operating in a manner which intends to maximize its emission characteristics in a continuous normal application.

# 6.2 EUT Exercise

The EUT (Transmitter) was operated in the engineering mode to fix the Tx frequency which was for the purpose of the measurements.

# 6.3 Configuration of Tested System

#### Remote Side

# 6.4 Description of Test Modes

The EUT has been tested under operating condition.

EUT staying in continuous transmitting mode. Channel Low, Mid and High for each type band with rated data rate were chosen for full testing.

The field strength of spurious radiation emission was measured as EUT stand-up position (H mode) and lie down position (E1, E2 mode) for three modes (GSM850, PCS1900, WCDMA Band V and WCDMA Band II) with power adaptor, earphone and Data cable. The worst-case H mode for GSM850, PCS1900, UMTS 850 and UMTS 1900.

|                   | 2. During the measurement, the EUT was communication with the station. The highest emission was recorded with the rotation of the turntable and the lowering of the test antenna from 4m to 1m. The reading was recorded and the field strength (E in dBuV/m) was calculated. |
|                   | 3. ERP in frequency band 824.2 –848.80.8MHz were measured using a substitution method. The EUT was replaced by dipole antenna connected, the S.G. output was recorded and ERP was calculated as follows:  |
|                   | ERP = S.G. output (dBm) + Antenna Gain (dBd) – Cable Loss (dB)  |
|                   | 4. EIRP in frequency band 1850.2 –1909.8MHz were measured using a substitution method. The EUT was replaced by or horn antenna connected, the S.G. output was recorded and EIRP was calculated as follows:  |
|                   | EIRP = S.G. output (dBm) + Antenna Gain (dBi) - Cable Loss (dB)   |
|                   | 5. The worse case was relating to the conducted output power.   |

|                   | <ul> <li>was determined using the substitution method.</li> <li>4. The spurious emissions attenuation was calculated as the difference between radiated power at the fundamental frequency and the spurious emissions frequency.</li> <li>ERP / EIRP = S.G. output (dBm) + Antenna Gain(dB/dBi) – Cable Loss (dB)</li> </ul> |

# 6.11 Frequency stability V.S. Temperature measurement

| Test Requirement: | FCC Part 2.1055(a)(1)(b)  |
|-------------------|---|
| Test Method:      | FCC Part 2.1055(a)(1)(b)  |
| Limit:            | 2.5 ppm   |
| Test setup:       | Spectrum analyzer  EUT  Att.  Variable Power Supply   |
|                   | Note: Measurement setup for testing on Antenna connector  |
| Test procedure:   | <ol> <li>The equipment under test was connected to an external DC power supply and input rated voltage.</li> <li>RF output was connected to a frequency counter or spectrum analyzer via feed through attenuators.</li> <li>The EUT was placed inside the temperature chamber.</li> <li>Set the spectrum analyzer RBW low enough to obtain the desired frequency resolution and measure EUT 25 °C operating frequency as reference frequency.</li> <li>Turn EUT off and set the chamber temperature to -30 °C. After the temperature stabilized for approximately 30 minutes recorded the frequency.</li> <li>Repeat step measure with 10 °C increased per stage until the highest temperature of +50 °C reached</li> </ol> |
| Test Instruments: | Refer to section 5.8 for details  |
| Test mode:        | Refer to section 5.3 for details  |
| Test results:     | Passed  |
| Remark:           | All three channels of all modulations have been tested, but only the worst channel and the worst modulation show in this test item.   |

# 6.12 Frequency stability V.S. Voltage measurement

| Test Requirement: | FCC Part 2.1055(d)(1)(2)   |  |  |  |  |
|-------------------|--|--|--|--|--|
| Test Method:      | FCC Part 2.1055(d)(1)(2)   |  |  |  |  |
| Limit:            | 2.5ppm   |  |  |  |  |
| Test setup:       | Spectrum analyzer  EUT  Att.  Variable Power Supply  |  |  |  |  |
|                   | Note: Measurement setup for testing on Antenna connector   |  |  |  |  |
| Test procedure:   | <ol> <li>Set chamber temperature to 25°C. Use a variable DC power source to power the EUT and set the voltage to rated voltage.</li> <li>Set the spectrum analyzer RBW low enough to obtain the desired frequency resolution and recorded the frequency.</li> <li>Reduce the input voltage to specify extreme voltage variation (+/-15%) and endpoint, record the maximum frequency change.</li> </ol> |  |  |  |  |
| Test Instruments: | Refer to section 5.8 for details   |  |  |  |  |
| Test mode:        | Refer to section 5.3 for details, and all channels have been tested, only shows the worst channel data in this report.   |  |  |  |  |
| Test results:     | Passed   |  |  |  |  |
